Sources

- [lucene](#)
- [solr](#)
-  3 Document names

Name The name used to group search results taken from this source. It can be a translation key.

```
platform.search.suggestSourceDocumentName
```

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

```
lucene
```

Service The search suggest service. It can be either a document reference or an external URL.

```
XWiki.SuggestLuceneService
```

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

```
name:__INPUT__* OR web:__INPUT__*
```

Limit The maximum number of search results taken from this source.

```
3
```

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

```
icon:page_white_text
```

Highlight Highlight the searched text in the search suggest results.

```
1
```

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

```
1
```

-  3 Document content

Name The name used to group search results taken from this source. It can be a translation key.

```
$services.localization.render('platform.search.suggestSourceDocumentContent')
```

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

Service The search suggest service. It can be either a document reference or an external URL.

```
$xwiki.getURL('XWiki.SuggestLuceneService', 'get', 'outputSyntax=plain')
```

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

```
__INPUT__*
```

Limit The maximum number of search results taken from this source.

```
3
```

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

```
$xwiki.getSkinFile('icons/silk/page_white_text.png')
```

Highlight Highlight the searched text in the search suggest results.

```
0
```

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

```
1
```

-  3 Attachment names

Name The name used to group search results taken from this source. It can be a translation key.

```
platform.search.suggestSourceAttachmentName
```

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

```
lucene
```

Service The search suggest service. It can be either a document reference or an external URL.

```
XWiki.SuggestLuceneService
```

XWiki - Search Suggest Configuration

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

```
filename:__INPUT__* AND type:attachment
```

Limit The maximum number of search results taken from this source.

3

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

```
icon:attach
```

Highlight Highlight the searched text in the search suggest results.

1

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

1

-  3 Attachment content

Name The name used to group search results taken from this source. It can be a translation key.

```
platform.search.suggestSourceAttachmentContent
```

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

```
lucene
```

Service The search suggest service. It can be either a document reference or an external URL.

```
XWiki.SuggestLuceneService
```

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

```
ft:__INPUT__* AND type:attachment
```

Limit The maximum number of search results taken from this source.

3

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

```
icon:attach
```

Highlight Highlight the searched text in the search suggest results.

0

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

1

-  3 Blog posts

Name The name used to group search results taken from this source. It can be a translation key.

```
platform.search.suggestSourceBlogPost
```

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

```
lucene
```

Service The search suggest service. It can be either a document reference or an external URL.

```
XWiki.SuggestLuceneService
```

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

```
__INPUT__* AND object:Blog.BlogPostClass
```

Limit The maximum number of search results taken from this source.

3

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

```
icon:page_white_picture
```

Highlight Highlight the searched text in the search suggest results.

0

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

0

-  3 Users

Name The name used to group search results taken from this source. It can be a translation key.

```
platform.search.suggestSourceUsers
```

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

```
lucene
```

XWiki - Search Suggest Configuration

Service The search suggest service. It can be either a document reference or an external URL.

`XWiki.SuggestLuceneService`

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

`__INPUT__* AND object:XWiki.XWikiUsers`

Limit The maximum number of search results taken from this source.

3

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

`icon:user`

Highlight Highlight the searched text in the search suggest results.

0

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

1

-  3 Wikis

Name The name used to group search results taken from this source. It can be a translation key.

`platform.search.suggestSourceWikis`

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

`lucene`

Service The search suggest service. It can be either a document reference or an external URL.

`xwiki:WikiManager.WikisSuggestLuceneService`

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

`XWiki.XWikiServerClass.wikiprettyname:__INPUT__*`

Limit The maximum number of search results taken from this source.

3

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

`icon:chart_organisation`

Highlight Highlight the searched text in the search suggest results.

1

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

1

-  3 Document names

Name The name used to group search results taken from this source. It can be a translation key.

`platform.search.suggestSourceDocumentName`

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

`solr`

Service The search suggest service. It can be either a document reference or an external URL.

`XWiki.SuggestSolrService`

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

`fq=type:DOCUMENT qf=title^2 name`

Limit The maximum number of search results taken from this source.

3

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

`icon:page_white_text`

Highlight Highlight the searched text in the search suggest results.

1

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

1

-  3 Document content

Name The name used to group search results taken from this source. It can be a translation key.

`platform.search.suggestSourceDocumentContent`

XWiki - Search Suggest Configuration

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

`solr`

Service The search suggest service. It can be either a document reference or an external URL.

`XWiki.SuggestSolrService`

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

`fq=type:DOCUMENT qf=doccontent^2 doccontentraw`

Limit The maximum number of search results taken from this source.

`3`

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

`icon:page_white_text`

Highlight Highlight the searched text in the search suggest results.

`0`

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

`1`

-  3 Attachment names

Name The name used to group search results taken from this source. It can be a translation key.

`platform.search.suggestSourceAttachmentName`

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

`solr`

Service The search suggest service. It can be either a document reference or an external URL.

`XWiki.SuggestSolrService`

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

`fq=type:ATTACHMENT qf=filename`

Limit The maximum number of search results taken from this source.

`3`

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

`icon:attach`

Highlight Highlight the searched text in the search suggest results.

`1`

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).

`1`

-  3 Attachment content

Name The name used to group search results taken from this source. It can be a translation key.

`platform.search.suggestSourceAttachmentContent`

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

`solr`

Service The search suggest service. It can be either a document reference or an external URL.

`XWiki.SuggestSolrService`

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

`fq=type:ATTACHMENT qf=attcontent`

Limit The maximum number of search results taken from this source.

`3`

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

`icon:attach`

Highlight Highlight the searched text in the search suggest results.

`0`

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).
