XWiki - SearchSuggestSourceSheet

Name The name used to group search results taken from this source. It can be a translation key.

Engine The search engine used to retrieve the results. This source is ignored if the current wiki is configured to use a different search engine.

Service The search suggest service. It can be either a document reference or an external URL.

Query The query that is passed to the search suggest service. It must contain a `__INPUT__` placeholder for the searched text.

Limit The maximum number of search results taken from this source.

Icon The icon used to mark search results taken from this source. E.g. `icon:user`

Highlight Highlight the searched text in the search suggest results.

Activated Whether this source is used or not (as long as the source search engine matches the search engine used by the current wiki).
